

Introduction

The ISL28474EVAL1Z evaluation board is a design platform containing all the circuitry needed to characterize critical performance parameters of the ISL28474 instrumentation and precision operational amplifiers, using a variety of user defined test circuits.

The ISL28474 is the combination of two micropower instrumentation amplifiers (Amp A) and two low power precision amplifiers (Amp B) in a single package. This device is optimized for 2.4V to 5V single supplies, and can be operated from one lithium cell or two Ni-Cd batteries.

Evaluation Board Key Features

The ISL28474EVAL1Z is designed to be operated from a single supply (+2.4VDC to +5VDC), or from split supplies (± 1.2 VDC to ± 2.5 V). Amp A is compensated for a gain of 100, and Amp B is compensated for a gain of 10. Each precision amplifier contains its own $\overline{\text{VREF}}$ input to establish an input common mode reference. An $\overline{\text{ENABLE}}$ select switch is provided for each amplifier to be used to save power by powering the device down.

Power Supplies (Refer to Figure 1)

External power connections are made through the VSP (+V), VSM (-V) and Ground connections on the evaluation board. For single supply operation, the VSM and Ground pins are tied together to the power supply negative terminal. For split supplies VSP and VSM connect to their respective power supply terminals. Resistors R_3 and R_{34} are 0Ω but can be changed by the user to provide power supply filtering, or to reduce the voltage rate-of-rise to less than ± 1 V/ μ s. Anti-reverse diodes D_1 , D_2 and D_3 protect the circuit in the case of accidental polarity reversal.
